PRELIMINARY STATEMENT 1

ARGUMENT 1

I. THE COURT’S MARKMAN III CONSTRUCTION OF
“TRANSMISSION SYSTEM” IS CORRECT 1

A. The Court Properly Construed the Term “Transmission System” in Light of the
Specification, Rather than Employing a Dictionary Definition 3

1. The law 4

2. Application of the law 7

a) the specification’s use of “transmission system” is incompatible
with its plain meaning 8

b) the specification defines a single transmission system, which is the
invention itself 14

B. There Is No Merit to Acacia’s Criticism of the Court’s Description
of “Transmission System” as a Coined Term 19

C. There Is No Merit to Acacia’s Criticism of the Court’s Use of “Means”
Language in the Definition of “Transmission System” 20

II. THE COURT’S MARKMAN III CONSTRUCTION OF
“RECEIVING SYSTEM” IS CORRECT 21

III. THE COURT’S CONSTRUCTION OF “SEQUENCE OF ADDRESSABLE
DATA BLOCKS,” WHILE CORRECT, SHOULD BE CLARIFIED 27

A. Relative Addresses Need Not Be Time Codes 28

B. The Court Should Clarify its Construction to Explicitly State That
“Addressable Data Blocks” Means That the Storage Location of the
Start of the File Containing the Data Blocks Is Known 30

IV. THE COURT CORRECTLY ADOPTED ACACIA’S ORIGINAL POSITION
THAT “STORING” REQUIRES THE AFFIRMATIVE ACT OF “PLACING” 31

A. Throughout this Litigation, Acacia Itself Has Repeatedly and Consistently
Argued That “Storing” Requires the Active Step of “Placing” Or “Adding” 32

1	B.	In the Context of Claim 41, “Storing” must Be the Active Step of “Placing”	34
2	C.	The Patentees’ Use of the Word “Inputting” in Claim 14 of the	
3		’863 Patent Supports the Court’s Construction of “Storing”	36
4	V.	THE COURT CORRECTLY CONCLUDED THAT CLAIM 45 OF THE	
5		’992 PATENT IS ARGUABLY INDEFINITE	37
6	A.	Acacia Mischaracterizes the Court’s Opinion	38
7	B.	Claim 45 is indefinite	39
8	VI.	THERE IS NO WAY TO TELL WHEN THE STEP “GENERATING A	
9		LISTING OF AVAILABLE ITEMS” IN CLAIM 46 TAKES PLACE	39
10	VII.	ACACIA’S ATTEMPT TO REWRITE THE SPECIFICATION AT	
11		COL. 17:44-53 SHOULD BE REJECTED	41
12		CONCLUSION	42

As discussed below, the Court’s constructions of the claim terms at issue are well-reasoned and correct. With the exception of one clarification to the construction of “sequence of addressable data blocks” agreed to by Acacia and the Round 3 Defendants, there is no reason to disturb the Court’s constructions of these terms.

I. THE COURT’S MARKMAN III CONSTRUCTION OF “TRANSMISSION SYSTEM” IS CORRECT

³On April 27, 2007, on consent of all of the parties, the Court ordered Acacia's opening brief to be filed by May 18, 2007. The brief Acacia filed on that day did not address claims 45 and 46 of the '992 patent. Instead, without seeking or obtaining leave of Court or the consent of defendants, Acacia filed a separate brief addressing claims 45 and 46 on May 23, 2007.

1 with, the plain meaning of “transmission system.” From the very first time the Court considered the
2 term, in its First Claim Construction Order dated July 12, 2004 (“July 12 Order”), the Court’s
3 construction reflected the fact that the specification gave the term “transmission system” a special
4 meaning that is different from its ordinary meaning. As the Court explained:

6 In the July 12 Order, the Court treated ‘transmission system’ as a term
7 with a special meaning, namely, ‘an assembly of elements, hardware
8 and software, that function together to convert items of information for
9 storage in a computer compatible form and subsequent transmission to
10 a reception system.’ (July 12 Order at 27-28). The Court’s July 12
11 definition recognizes that by ‘transmission system’ the patentee meant
12 something more than an apparatus which ‘transmits.’

13 (Markman III at 6.)

14 In Markman III, the Court reaffirmed its conclusion that the patents impart a special
15 meaning to the phrase “transmission system.” However, the Court correctly concluded that it should
16 modify its earlier construction because “the July 12 Order recognize[d] some but not all of the
17 components of what the patentee meant by the phrase ‘transmission system.’” (*Id.*) Accordingly, the
18 Court construed “transmission system” as follows:

19 An apparatus which comprises the following interconnected
20 components: a source material library means, an identification
21 encoding means, a conversion means, an ordering means, a
22 compression means, a compressed data storing means (as illustrated in
23 the block diagram labeled Figure 2a), and a compressed data storage
24 means and a transmitter means (as illustrated in the block diagram
25 labeled Figure 2b). The corresponding structure for each means is the
26 structure identified in the specification for performing the recited
27 function.

28 (Markman III at 8.) Acacia criticizes the foregoing construction in a variety of respects, each of
which is answered below.

1 **A. The Court Properly Construed the Term “Transmission System” in Light of the**
2 **Specification, Rather than Employing a Dictionary Definition**

3 Acacia argues that the term “transmission system” should be construed in accordance
4 with its plain meaning as provided in the IEEE Dictionary.⁴ However, it completely ignores the fact
5 that this plain meaning does not cover the “transmission system” which is disclosed and claimed in
6 the Yurt patents. The IEEE Dictionary defines “transmission system” as the distinct set of
7 components that together “transmit signal waves.” The “transmission system” disclosed and claimed
8 in the Yurt patents, however, includes many components having nothing to do with the transmission
9 of the signals, such as storage libraries and an identification encoder. Because the dictionary
10 definition of “transmission system” is incompatible with the use of the term in the Yurt patents, and
11 excludes the transmission system actually disclosed in the specification, it is clear that the patentees
12 coined a new meaning for the term. The specification is the only source for determining what that
13 meaning is, and in the specification, “transmission system” is defined to mean the system described
14 in column 2 and depicted in figure 2.⁵

17 Acacia acknowledges in its brief that patentees cannot claim more broadly than what
18 is disclosed in the specification. Therefore, Acacia argues that the specification, including the
19 originally filed claims, discloses many different transmission systems. However, all of the excerpts
20 from the specification relied on by Acacia, including the originally filed claims, confirm that the
21 specification discloses only one “transmission system,” which is described at column 2 and depicted
22 in figure 2. All of these excerpts also demonstrate that the Court’s construction accurately and
23

24
25
26

⁴*The New IEEE Standard Dictionary of Electrical and Electronic Terms* 1405 (5th ed. 1993).

27 ⁵Citations to the common specification of the Yurt patents herein are to the ’992 patent unless
28 otherwise indicated.

1 precisely captures this one transmission system. Indeed, the patentees considered their “transmission
2 system,” as construed by the Court, to be the invention itself.

3 Finally, even if Acacia was correct that the specification discloses different
4 transmission systems, this would not support Acacia’s argument that the Court should construe
5 “transmission system” pursuant to its plain meaning because the plain meaning does not cover any of
6 these alleged embodiments. All of the alleged embodiments have storage libraries, identification
7 encoders and other elements that are excluded by the plain meaning of “transmission system.”
8 Instead, the Court’s construction would *still be the correct construction*, as it is the broadest
9 construction of “transmission system” contemplated and disclosed by the patentees.
10

11 As discussed further below, the Court was compelled for all of these reasons to
12 construe “transmission system” in accordance with the special meaning that the patentees gave the
13 term.
14

15 1. The law

16 Acacia misstates the law when it asserts that a claim term must be given its ordinary
17 and accustomed meaning unless the specification explicitly sets forth a different definition. (Acacia
18 Br. at 2, 4-5.)⁶ Indeed, the proposition urged by Acacia was expressly repudiated by the Federal
19 Circuit’s *en banc* decision in *Phillips v. AWH Corp.*, 415 F.3d 1303, 1320-24 (Fed. Cir. 2005) (*en*
20 *banc*).
21

22 In *Phillips*, the Court explained that “the person of ordinary skill in the art is deemed
23 to read the claim term not only in the context of the particular claim in which the disputed term
24

25
26 ⁶“Acacia Br.” herein refers to Plaintiff Acacia Media Technologies Corporation’s
27 Memorandum of Points and Authorities in Support of its Motion for Reconsideration of Certain
28 Claim Construction Terms Construed by the Court in its Third Claim Construction Order and its
Forth Claim Construction Order, filed 5/18/07.

1 appears, but in the context of the entire patent, including the specification.” *Phillips*, 415 F.3d at
2 1313. The Court noted that “patentees frequently use terms idiosyncratically,” *id.* at 1314, and that
3 “the specification may reveal a special definition given to a claim term by the patentee that differs
4 from the meaning it would otherwise possess. In such cases, the inventor’s lexicography governs.”
5 *Id.* at 1316. Therefore, “[i]t is entirely appropriate for a court, when conducting claim construction,
6 to rely heavily on the written description for guidance as to the meaning of the claims.” *Id.* at 1317.⁷

7
8 The *Phillips* Court then turned to the argument, asserted by Acacia here, that a claim
9 term is presumed to have its ordinary meaning unless the specification explicitly states otherwise.
10 *Id.* at 1320-24. The Court rejected such an approach as “improperly restrict[ing] the role of the
11 specification in claim construction.” *Id.* at 1320. The Court explained that “requiring that any
12 definition of claim language in the specification be express, is inconsistent with our rulings that the
13 specification is ‘the single best guide to the meaning of a disputed term,’ and that the specification
14 ‘acts as a dictionary when it expressly defines terms used in the claims or when it defines terms by
15 implication.’” *Id.* at 1321 (citations omitted). Thus, even a claim term with a plain, well-understood
16 meaning can be defined in the specification by implication if the patentees use the term to refer to
17 something different than the plain meaning. *Honeywell Int’l, Inc. v. Universal Avionics Corp.*, 2007
18 U.S. App. LEXIS 15820, (Benyacar Decl. Ex. H), at *6 (Fed. Cir. July 3, 2007) (construing the claim
19
20
21

22
23 ⁷See also *Network, LLC v. Centraal Corp.*, 242 F.3d 1347, 1352 (Fed. Cir. 2001) (“The
24 claims are directed to the invention that is described in the specification; they do not have meaning
25 removed from the context from which they arose.”); *The Toro Co. v. White Consol. Indus., Inc.*, 199
26 F.3d 1295, 1299 (Fed. Cir. 1999) (“[W]ords of ordinary usage must nonetheless be construed in the
27 context of the patent documents. Thus the court must determine how a person of experience in the
28 field of this invention would, upon reading the patent documents, understand the words used to
define the invention.”); *Renishaw PLC v. Marposs Societa’ per Azioni*, 158 F.3d 1243, 1250 (Fed.
Cir. 1998) (“[T]he interpretation to be given a term can only be determined and confirmed with a full
understanding of what the inventors actually invented and intended to envelop with the claim.”).

1 term “heading” to mean “bearing” because “[t]he specification and the prosecution history make
2 clear . . . that the patentees used the term ‘heading’ in a manner different from its ordinary
3 meaning.”).

4
5 As the Federal Circuit also pointed out in *Phillips*, it has been settled law for over a
6 century that claims cannot have a broader scope than what is disclosed in the specification. *See*
7 *Phillips*, 415 F.3d at 1323 (observing that in *Snow v. Lake Shore & Mich. S. Ry. Co.*, 121 U.S. 617,
8 630 (1887), “it was clear from the specification that there was ‘nothing in the context to indicate that
9 the patentee contemplated any alternative’ embodiment to the one presented”); *Wang Labs., Inc. v.*
10 *Am. Online, Inc.*, 197 F.3d 1377, 1383 (Fed. Cir. 1999) (limiting claims to the “only embodiment
11 described in the ’669 patent”). Acacia itself acknowledges that a claim term cannot be construed
12 more broadly than the use of the term in the specification, even if the term has a broader plain
13 meaning. As Acacia says in its discussion of the Court’s construction of “sequence of addressable
14 data blocks”:

15
16 The facts of the present case are similar to those in *Toro Co. v. White*
17 *Consolidated Industries, Inc.*, 199 F.3d 1295, 1301 (Fed. Cir. 1999).
18 In *Toro*, the court construed the claim terms ‘cover’ and ‘including’ to
19 require that the claim elements, the cover and the ring, be attached to
20 one another. In consulting the specification to determine the context in
21 which these claim terms were used, the court held that the only
22 description in the specification of the cover and ring showed that the
23 cover was attached to the ring, and therefore the specification could
24 not support a broader construction for these terms.

25 (Acacia Br. at 16-17.) Acacia is similarly familiar with the wide body of case law which so holds, as
26 it provides the following additional authority: “*Toro*, 199 F.3d at 1301 (“The specification does not
27 describe an invention broader than this description of the cover and the restriction ring
28 “automatically” inserted and removed together. Nowhere in the specification, including its twenty-
one drawings, is the cover shown without the restriction ring attached to it.”); *See also Irdeto Access*,

1 *Inc. v. EchoStar Satellite Corp.*, 383 F.3d 1295, 1301 (Fed. Cir. 2004) (“Indeed, the specification
2 consistently uses the term ‘group’ to refer to a subset of all subscribers. . . . Nowhere does the
3 specification contemplate a single group made up of the entire subscriber base.”); *Bell Atlantic*
4 *Network Servs., Inc. v. Covad Commc’ns, Inc.*, 262 F.3d 1258, 1271 (Fed. Cir. 2001) (“When a
5 patentee uses a claim term throughout the entire patent specification, in a manner consistent with
6 only a single meaning, he has defined the term ‘by implication.’”).” (Acacia Br. at 17 n.21.)

8 Finally, as the Court has correctly observed, where it is clear from the specification
9 that an embodiment is the invention itself, the claims must be limited to that invention. *Modine Mfg.*
10 *Co. v. United States Int’l Trade Comm’n*, 75 F.3d 1545, 1551 (Fed. Cir. 1996) (*abrogated on other*
11 *grounds, Festo Corp. v. Shoketsu Kinzoku Kogyo Kabushiki Co.*, 234 F.3d 558 (Fed. Cir. 2000),
12 *rev’d*, 535 U.S. 722 (2002)); *accord Scimed Life Sys., Inc. v. Advanced Cardiovascular Sys., Inc.*,
13 242 F.3d 1337, 1343 (Fed. Cir. 2001) (“[T]he characterization of the coaxial configuration as part of
14 the ‘present invention’ is strong evidence that the claims should not be read to encompass the
15 opposite structure.”)

17 Thus, this Court properly looked to the specification – which the Federal Circuit has
18 called the “the single best guide to the meaning of a disputed term,” *Phillips*, 415 F.3d at 1321 – in
19 determining what the patentees meant by the term “transmission system.”

21 **2. Application of the law**

22 The Court determined that the patentees used the term “transmission system” to mean
23 the “particular assembly of elements depicted in the drawings and described in the specification.”
24 (Markman III at 8:7-9.) The Court therefore construed the claim term “transmission system” to mean
25 the disclosed transmission system. This construction is clearly correct. The patentees used the term
26 “transmission system” in the specification in a manner that is incompatible with its ordinary
27
28

1 meaning, demonstrating that they coined a new meaning for the term. Furthermore, the term
2 “transmission system” is not entitled to a construction that covers systems never described or
3 contemplated in the specification. Each of these points is addressed in more detail below.

4
5 **a) the specification’s use of “transmission system” is incompatible**
6 **with its plain meaning**

7 While arguing that “transmission system” has a plain meaning, Acacia ignores the
8 fact that the use of the term in the specification is not compatible with that plain meaning. The IEEE
9 Dictionary defines “transmission system” as the specific elements that together “transmit signal
10 waves.” The “transmission system” disclosed and claimed in the Yurt patents, however, includes
11 many components having nothing to do with the transmission of the signals, such as storage libraries
12 and an identification encoder. The dictionary definition of “transmission system” excludes these
13 components, and therefore does not cover the “transmission system” described in the specification.
14 Although Acacia submitted a declaration of Merrill Weiss stating that the term “transmission
15 system” has a plain meaning, Mr. Weiss never disputes the fact (previously briefed and argued by the
16 Round 3 Defendants) that this plain meaning does not read on the disclosed transmission system. If
17 the Court adopted Acacia’s construction, “the disclosed embodiment would not relate to any
18 limitation of the claimed invention, despite the clear link between” the transmission system
19 “discussed in the specification” and the transmission system “called for by the claims.” *Honeywell*,
20 2007 U.S. App. LEXIS 15820, (Benyacar Decl. Ex. H), at *8.

21
22
23 The Round 3 Defendants also submit herewith the declaration of Dr. Stephen Walters
24 confirming, based on his experience and on the technical literature, that the dictionary definition of
25 “transmission system” excludes components that are defined as part of the “transmission system” in
26 the specification. The use of the term in the technical literature makes clear, as does the IEEE
27 definition, that “transmission systems” cannot include components not involved in transmitting
28

1 signals. These other definitions, like the IEEE definition, focus on the distinct subset of components
2 in information processing and communication systems responsible for transmitting the signals over a
3 communications medium, and the medium itself:
4

5 A transmission system in its simplest form is a pair of wires connecting two
6 telephones. More commonly, a transmission system is a complex aggregate of
7 electronic gear and the associated medium, which together provide a multiplicity of
8 channels over which many customers' messages and associated control signals can be
9 transmitted. In general, a call between two points will be handled by connecting a
10 number of different transmission systems in tandem to form an overall transmission
11 connection between two points. Bell Laboratories, *Transmission Systems for*
12 *Communications* 1 (5th ed. 1982).⁸ (Benyacar Decl. Ex. A.)

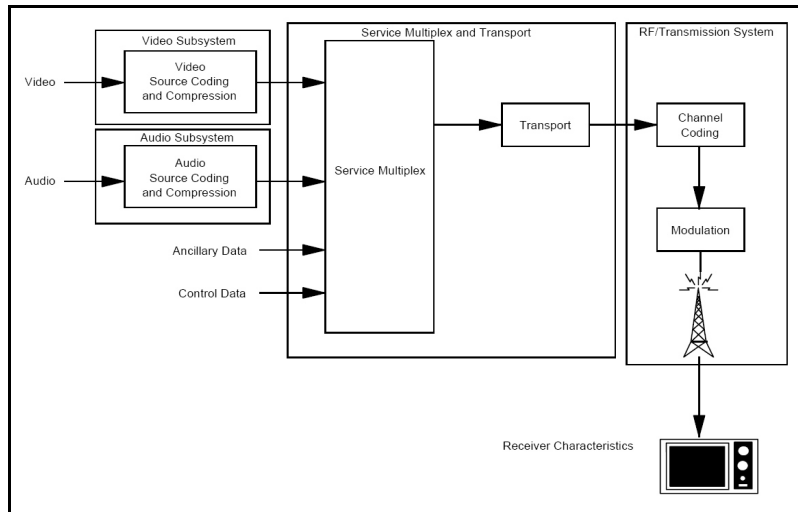

13 Transmission systems exist to provide circuits for transmitting speech and other
14 signals between the nodes of a telecommunications network. . . Present-day
15 transmission systems range in complexity from simple unamplified audio-frequency
16 lines to satellite radiocommunication systems. J.E. Flood & P. Cochrane,
17 *Transmission Systems* 19 (Peter Peregrinus Ltd. 1991); (Benyacar Decl. Ex. B.)

18 transmission system: Part of a communication system organized to accomplish the
19 transfer of information from one point to one or more other points by means of
20 signals. Alliance for Telecommunications Industry Solutions, *Telecom Glossary 2000*
21 (2001), http://www.atis.org/tg2k/_transmission_system.html; (Benyacar Decl. Ex. C.)

22 (Walters Decl. ¶ 16.)

23 A diagram which illustrates this plain meaning of “transmission system” is included
24 in the ATSC Digital Television Standard specification, which is the television industry’s standard for
25 over-the-air transmission of digital television signals. The system for broadcasting these television
26 signals is depicted as follows:
27

28 ⁸“Transmission system” had the same plain meaning in 1991 as it has today. (Walters Decl. ¶ 18.)

Advanced Television Systems Committee, *ATSC Digital Television Standard and Amendment No. 1* 18 (1995). Only those components of the broadcasting system used to format the information specifically for transmission and for placing the signals onto the transmission medium are indicated as being a part of the “transmission system.” As this standards document explains:

‘RF/Transmission’ refers to channel coding and modulation. The channel coder takes the data bit stream and adds additional information that can be used by the receiver to reconstruct the data from the received signal which, due to transmission impairments, may not accurately represent the transmitted signal. The modulation (or physical layer) uses the digital data stream information to modulate the transmitted signal.

Id. at 19; (Walters Decl. ¶ 17; Benyacar Decl. Ex. D.)

Likewise, by defining “transmission system” as “an assembly of elements capable of functioning together to **transmit** signal waves,” and the word “transmit” to mean “[t]o move data from one location to another location,” (Benyacar Decl. Ex. E), the IEEE dictionary definition makes clear that “transmission system” constitutes only those elements which transmit or move the information. (Walters Decl. ¶ 19.) In addition, an alternative definition in the same IEEE dictionary relied upon by Acacia also clearly limits the “transmission system” to the specific components

1 responsible for transmitting the information over a transmission medium and the physical medium
2 itself: “[t]he interface and transmission medium through which peer physical layer entities transfer
3 bits.” (Walters Decl. ¶ 20; Benyacar Decl. Ex. E.)
4

5 This plain meaning of “transmission system” is not consistent with the use of the term
6 in the specification of the Yurt patents. Pursuant to the plain meaning, the only components of figure
7 2 that would be part of a “transmission system” are “transmission format conversion CPU” 119,
8 “transceiver” 122 and the various types of media depicted (ISDN, B ISDN, Satellite, etc.) in figure
9 2b. (Walters Decl. ¶ 21.)⁹ As used in the specification, however, all of the devices depicted in series
10 in figures 2a and 2b, from the source material library to the transmitter, are part of the transmission
11 system. The “transmission system” defined in the specification thus includes two storage libraries - a
12 “source material library” for physical items containing information (such as books, still pictures,
13 computer tapes and musical instruments) (col. 5:66-6:34) and a “compressed data library” for
14 information in compressed form (col. 10:31-57.) Storage libraries are antithetical to the functions
15 and objectives of plain-meaning transmission systems because transmission systems are designed to
16 move information, not to store and maintain it. (Walters Decl. ¶ 22.) Similarly, the plain meaning of
17 “transmission system” is incompatible with including an “identification encoder” in a transmission
18 system. According to the specification, an identification encoder performs “storage encoding,”
19
20
21

22
23 ⁹As Dr. Walters explains: “[t]ransmission system’ refers to the components that prepare
24 information for real-time transmission (*i.e.*, the information is transmitted immediately after it is
25 prepared for transmission), the components that place information-bearing signals onto a
26 transmission medium, and the physical transmission medium itself.” (Walters Decl. ¶ 16.) “[T]he
27 ‘transmission format conversion CPU’ 119 prepares the information specifically for transmission in
28 real time, the transmitter places the signals onto the medium, and the terms ‘ISDN, Satellite’ etc. are
used to refer to the medium itself.” (Walters Decl. ¶ 21.) Therefore, it is only these three components
of figure 2 that would be part of a plain-meaning transmission system. (*Id.*) As Dr. Walters also
points out, however, only the portion of element 119 which formats the information would be part of
the transmission system - not the portion that receives and reacts to user requests. (*Id.* at n.3.)

1 which includes assigning unique identification codes and file addresses where information will be
2 stored in the compressed data library. (col. 6:35-54.) As Dr. Walters says, “such codes and
3 addresses have no role in transmission.” (Walters Decl. ¶ 23.) Because storage libraries perform
4 the exact opposite function of moving information, and because the source material library, the
5 compressed data library and the identification encoder all relate to saving and retrieving information
6 to and from storage libraries, all three of these components of the patented “transmission system” are
7 incompatible with the plain meaning of “transmission system.” (Walters Decl. ¶ 24.)

8
9 Other functions performed by the disclosed “transmission system” are also
10 incompatible with the plain meaning of that term. For example, the disclosed “transmission system”
11 receives and processes user requests: “[T]he first step of the distribution method 400 involves
12 retrieving the information for selected items in the source material library 111, upon a request by a
13 user” (col. 18:53-56); “[t]he transmission format means 119 receives the request and retrieves
14 the composite formatted data block of the requested item stored in compressed data library 118”
15 (col. 13:40-43.) Plain-meaning “transmission systems” do not perform this function, as they are not
16 involved in determining what information is to be transmitted. The only function of the transmission
17 system is to move information provided to it from one place to another. (Walters Decl. ¶ 25.)

18
19 Not surprisingly, because the only disclosed “transmission system” is incompatible
20 with the plain meaning of the term, there are many claimed method steps which are required to be
21 performed by a “transmission system” which plain-meaning transmission systems cannot perform.
22 Dr. Walters provides the following examples of such method steps (Walters Decl. ¶ 26): “storing
23 items having information in a source material library” (’992 Patent, claim 41); “inputting an item
24 having information into a transmission system” (’863 Patent, claims 14 and 17); “retrieving the
25 information in the items from the source material library” (’992 Patent, claim 41); “assigning a
26
27
28

1 unique identification code to the retrieved information” (*id.* at claim 41); “assigning a unique
2 identification code to the item having information” (’863 Patent, claims 14 and 17); “placing the
3 formatted data into a sequence of addressable data blocks” (’992 Patent, claim 41); “formatting the
4 item having information as a sequence of addressable data blocks” (’863 Patent, claims 14 and 17);
5 and “storing, as a file, the compressed, formatted, and sequenced data blocks with the assigned
6 unique identification code.” (’992 Patent, claim 41; ’863 Patent, claim 14.)
7

8 Dr. Walters also explains that if the dictionary definition of “transmission system”
9 covered all equipment that is connected directly or indirectly to transmitting equipment, as Acacia
10 seems to argue, the term would have no meaning. For example, there would be no way to
11 distinguish a “transmission system” from a “receiving system,” because all of the components on any
12 network would be part of the “transmission system.” All computers, information processing devices
13 and storage devices directly or indirectly connected to a network would be part of the same single
14 transmission system. In fact, all information processing devices and storage devices on the planet
15 which are directly or indirectly connected to any public network (such as the Internet, the telephone
16 network, etc.), as well as all of these networks themselves, would make up a single transmission
17 system since information can be transmitted from any device to any other device. (Walters Decl.
18 ¶ 27.) Accordingly, the only alternative to construing the term “transmission system” to mean the
19 transmission system disclosed in the specification is to render the term indefinite. (Round 3
20 Defendants’ 8/11/06 Br., Docket No. 198, at 7-10.)
21
22

23 Because the ordinary meaning of “transmission system” is incompatible with its use
24 in the specification and claims, and would exclude the only transmission system disclosed in the
25 specification, it is clear that the patentees coined a new definition for the term “transmission system.”
26
27
28

1 **b) the specification defines a single transmission system, which is the**
2 **invention itself**

3 As the Court has correctly recognized, the specification defines and contemplates *one*
4 transmission system, which is summarized in column 2 under the heading “SUMMARY OF THE
5 INVENTION” and which is more fully described in figures 2a and 2b (and its related text in the
6 specification). The Court therefore properly construed the claim term “transmission system” in view
7 of that disclosed transmission system. (*See supra* at § I(A)(1).) Although Acacia argues that the term
8 “transmission system” is used in the specification to describe a variety of different systems, Acacia is
9 wrong.
10

11 Contrary to Acacia’s assertion, there is no inconsistency between the system
12 summarized in column 2 and the system depicted in figure 2 of the specification. Column 2
13 describes an “ordering means . . . for placing the formatted data into a sequence of addressable data
14 blocks; [and] compression means, coupled to the ordering means, for compressing the formatted and
15 sequenced data” (col. 2:37-41.) Thus, after the sequence of addressable data blocks is created
16 by the ordering means, the data is compressed by the compression means. Similarly, in figure 2a, the
17 sequence of addressable data blocks is created by the time encoder **114**,¹⁰ after which it is formatted
18 for compression by precompressor processor **115** and compressed by compressor **116**. (col. 7:59-col.
19 8:6.)
20
21

22 Acacia argues that because figure 2a has a precompression processor **115** between
23 time encoder **114** and compressor **116**, the compression means is not “coupled to” the ordering
24 means as required by the description in column 2, and is therefore an alternate embodiment. That is
25 incorrect. As the specification teaches, formatting for compression is a necessary part of
26

27 ¹⁰The manner in which data blocks become “addressable” is described in more detail in
28 Section III herein.

1 compression. (*See, e.g.*, col. 8:67-col. 9:2) (“Video precompression processor **115b** buffers
2 incoming video data and converts the aspect ratio and frame rate of the data, *as required by*
3 *compression processor 116.*”) Accordingly, one skilled in the art would understand that the
4 precompression processor **115** is part and parcel of the “compression means” that is described in the
5 summary of the invention in column 2. (Walters Decl. ¶¶ 31-33.)¹¹ Indeed, the specification
6 repeatedly describes precompression processing as part of compression. (*See* col. 7:46-47)
7 (“compression by precompression processor **115** and compressors **128** and **129**”); (col. 8:5-6)
8 (“compression processing by precompression processor **115** and compressor **116**”).
9

10
11 Lest there be any doubt, the specification *specifically* describes the precompression
12 processor as part of the “compression means.” In particular, the specification states:

13 The transmission system **100** of the present invention also preferably¹²
14 includes data compression means for compressing the formatted and
15 sequenced data. The sequence of addressable data blocks which was
16 time encoded and output by the time encoder **114** is preferably sent to
17 precompression processor **115**.

18 (col. 8:57-62.) Thus, in figure 2a, the ordering means (time encoder **114**) *is* “coupled to” the
19 compression means (precompression processor **115** and compressor **116**). Contrary to Acacia’s
20 assertion, there is no inconsistency between the system depicted in figure 2a and the summary of that
21 same system that is set forth in column 2 of the specification.
22

23
24 ¹¹Those of ordinary skill in the art would not read a technical specification in such a way that
25 it discloses two embodiments, one of which is inoperative (e.g., employing compression without the
26 required precompression processing), if there is a reasonable way to read the specification such that
27 it describes the same, one operative embodiment. An inoperative embodiment is simply not an
28 alternative embodiment. (Walters Decl. ¶ 36.)

¹²As Acacia itself points out (Acacia Br. at 19-20), the specification’s use of the word
“preferably” does not imply a broader construction.

1 Nor is there any merit to Acacia’s argument that a transmission system having a
2 “transmitter means coupled to the compressed data storing means,” as described at col. 2:46-47, is a
3 different transmission system than is depicted in figure 2b, which shows a “transmission format
4 conversion CPU” **119** between transceiver **122** and the compressed data library **118**. (Acacia Br. at
5 6-7.) The “transmission format conversion CPU” **119** in figure 2b “converts the compressed
6 formatted data block into a format suitable for transmission.” (col. 13:40-45.) Thus, just as the
7 formatter for compression is part of the “compression means,” the formatter for transmission is part
8 of the “transmitter means.”¹³ (Walters Decl. ¶ 35.) Indeed, original claim 2 – on which Acacia itself
9 heavily relies (Acacia Br. at 8) – explicitly states that the “transmission format means” is part of the
10 “transmitter means.” (See Block Decl. Ex. 1 at claim 2)¹⁴ (“wherein the transmitter means includes:
11 transmission format means . . .”).
12

13
14 In other words, the “transmission format conversion CPU” **119** and the transmitter
15 **122** together comprise the “transmitter means” that is summarized in column 2. Thus, contrary to
16 Acacia’s assertion, figure 2b *does* depict a transmitter means coupled to the compressed data storing
17 means. Again, there is no inconsistency.
18

19 Next, Acacia argues that the originally-filed claims describe additional, different
20 transmission systems. However, the only originally-filed independent claim that defines the
21

22 ¹³The disclosed transmission system would not work without the “transmission format
23 conversion CPU” **119**. According to the specification, it is element **119** that retrieves the
24 information from the compressed data library after the user requests it. (col. 13:40-45.) Without it,
25 then, there would be no way to transmit the information to the user. Acacia is thus again reading one
of several descriptions of the same embodiment in a manner which would render it inoperable, and
then relying on this inoperable description as an alternative embodiment.

26 ¹⁴“Block Decl.” herein refers to the Declaration of Alan P. Block in Support of Plaintiff
27 Acacia Media Technologies Corporation’s Motion for Reconsideration of Certain Claim
28 Construction Terms Construed by the Court in its Third Claim Construction Order and its Forth
Claim Construction Order, filed 5/18/07.

characteristics of a transmission system, claim 1 (Block Decl. Ex. 1 at claim 1), describes the exact same transmission system that is described in column 2 and depicted in figure 2, and *contains every single limitation which the Court included in its construction of “transmission system.”* Below is a comparison of originally-filed claim 1 and the Court’s construction of “transmission system”:

Originally Filed Claim 1 (Block Decl. Ex. 1 at claim 1)	Court’s Construction Of “Transmission System” (Markman III at 8)
1. A transmission system for providing information to remote locations, the transmission system comprising:	A “transmission system” is “an apparatus which comprises the following interconnected components:”
library means for storing items;	“a source material library means,”
identification encoding means for retrieving the information for the items from the library means and for assigning a unique identification code to the retrieved information;	“an identification encoding means,”
conversion means, coupled to the identification encoding means, for placing the retrieved information into a predetermined format as formatted data;	“a conversion means,”
ordering means, coupled to the conversion means, for placing the formatted data into a sequence of addressable data blocks;	“an ordering means,”
compression means, coupled to the ordering means, for compressing the formatted and sequenced data;	“a compression means,”
compressed data storing means, coupled to the data compression means, for storing as a file the compressed, sequenced data received from the data compression means with the unique identification code assigned by the identification encoding means; and	“ a compressed data storing means... and”
transmitter means, coupled to the compressed data storing means, for sending at least a portion of a file to one of the remote locations.	“a transmitter means”

1 Originally-filed claim 1 thus demonstrates that the Court’s construction of “transmission system” is
2 not just the broadest conception of a “transmission system” that the applicants disclosed, it is the
3 very “transmission system” which the applicants described as the broadest invention they had. The
4 Court was thus correct in construing the claim term “transmission system” in accordance with this
5 definition. (*See supra* at § I(A)(1).) The fact that originally-filed dependent claims add additional
6 detail or suggest that additional components can be added to this one transmission system does not
7 constitute a disclosure of “different” transmission systems.¹⁵

9 For all of these reasons, *even if* the plain meaning of “transmission system” was
10 broader than (rather than incompatible with) the use of the term in the specification, the Court’s
11 construction would still be correct, because the Court’s construction captures the broadest
12 conception of “transmission system” that the patentees had and disclosed (as discussed *supra* at
13 § I(A)(1), patentees cannot claim more broadly than what is disclosed in the specification.) As
14 demonstrated in § I(A)(2)(a), however, the plain meaning of “transmission system” is not broader
15 than its use in the specification; it is incompatible with its use in the specification. Therefore, *even if*
16 Acacia was correct and, notwithstanding all of the above facts to the contrary, the specification could
17 be interpreted as describing different transmission systems, *the Court still could not construe*
18 *“transmission system” in accordance with its plain meaning.* Each of the allegedly different
19 transmission systems would still have storage libraries, an identification encoder and other elements
20 which are incompatible with the plain meaning of “transmission system.” Consequently, Acacia’s
21 argument that the specification discloses different transmission systems is not only wrong, it is
22 irrelevant.
23
24
25

26
27 ¹⁵Acacia also argues in a footnote that because figures 2a and 2b include details not included
28 in the “summary of invention” in column 2, the figures describe a different system. (Acacia Br. at 7
n.5.) Again, though, a more detailed description of a system does not make it different.

1 Finally, as the Court observed, the disclosed “transmission system” is repeatedly
2 described by the patentees as the invention itself, a fact which also compels the Court’s construction.
3 (Markman III at 7:19-8:11.) The title of all of the asserted Yurt patents is “Audio and Video
4 *Transmission and Receiving System*,” a title with which, as Acacia admits, the patentees intended to
5 convey the scope of the invention to which the claims were to be limited. (Acacia Br. at 19:5-10.)
6 Moreover, there are many references in the specification, in addition to the two relied on by the
7 Court, (Markman III at 8:1-6), which also describe the disclosed “transmission system” as the
8 invention itself: ’992 Patent, col. 1:6-7; 1:62-66; 1:67-2:4; 2:5-10; 2:11-15; 3:24-26; 3:27-29; 3:50-
9 52; 3:54-58; 3:61-64; 3:64-68; 4:1-5; 4:14-18; 4:19-22; 4:30-33; 4:34-36; 4:52-63; 6:35-39; 6:55-58;
10 7:59-61; 8:57-59; 9:9-12; 13:29-34; 15:61-65; 15:65-67.¹⁶
11
12

13 For all of the above reasons, the Court’s construction of “transmission system” is
14 correct. The Court’s construction is entirely consistent with the description of “transmission system”
15 in column 2, in figures 2a and 2b, and in the original claims. Acacia’s arguments to the contrary are
16 without merit.
17

18 **B. There Is No Merit to Acacia’s Criticism of the Court’s Description of**
19 **“Transmission System” as a Coined Term**

20 Acacia argues that the Court erred in describing “transmission system” as a “coined
21 term.” A coined term, according to Acacia, is something that has absolutely no meaning outside of
22 the patent, such as “ram-a-fram.” (Acacia Br. at 3 n.1.) Since the phrase “transmission system” was
23 known, according to Acacia, it is not a “coined term.”
24
25
26

27 ¹⁶Likewise, the inventors characterized the invention as a “transmission system” during
28 prosecution: “[t]he entire system includes a transmission system and a reception system.” (Benyacar
5/8/06 Decl., Docket No. 161, Ex. 5 (Petition to Make Special) at 2-3.)

1 Acacia's argument is much ado about nothing. It is unreasonable to interpret the
2 Court's opinion as stating that the patentees originated the phrase "transmission system." Rather, the
3 Court's meaning was crystal clear: the patentees gave the phrase "transmission system" a *special*
4 meaning that differed from its ordinary meaning. *See Honeywell*, 2007 U.S. App. LEXIS 15820,
5 (Benyacar Decl. Ex. H), at *6.

7 Acacia's argument that the Court determined "sua sponte" that the patentees used
8 "transmission system" as a coined term, and that "no party has ever contended that" transmission
9 system is a coined term, (Acacia Br. at 3), is both irrelevant and untrue. The Court has sole
10 responsibility for construing the claims, and is not bound by the arguments of any party. *Exxon*
11 *Chem. Patents, Inc. v. Lubrizol Corp.*, 64 F.3d 1553, 1556 (Fed. Cir. 1995). Moreover, the Round 3
12 Defendants did brief the fact that the term "transmission system" is used in the Yurt patents in a
13 manner incompatible with its plain meaning. (Round 3 Defendants' 8/11/06 Br. at 4-7.) In addition,
14 counsel stated during oral argument that "in effect, [the patentees] have coined a new term." (9/7/06
15 Tr. at 29:25-30:1.) Acacia's counsel stated that he understood the Round 3 Defendants' argument to
16 be that the patentees "must have been their own lexicographer." (9/7/06 Tr. at 53:1-2.) Accordingly,
17 Acacia has no basis to claim surprise.

18
19
20 **C. There Is No Merit to Acacia's Criticism of the Court's Use of "Means"**
21 **Language in the Definition of "Transmission System"**

22 Acacia misses the mark when it criticizes the Court for using "means" language in the
23 definition of "transmission system." The Court simply adopted the "means" language that *the*
24 *patentees* used to describe their "transmission system" invention in the specification. The Court
25 cannot be faulted for employing the very language that the patentees themselves used.

26 Moreover, although the patentees defined "transmission system" as the system
27 depicted in figures 2a and 2b, the specification's use of "means" language is an attempt to provide a
28

1 written description of the structural equivalents of each of the particular components of this system.
2 By adopting the specification's "means" language in its construction, the Court afforded the
3 patentees with the benefit of that disclosure, such that the claim term "transmission system" covers
4 both the specific interconnected components of figures 2a and 2b and the structural equivalents of
5 each of those components. It is difficult to understand how Acacia could take issue with the
6 propriety of this.
7

8 Finally, Acacia's objection to the "means" language does not in any way support its
9 own proposal that "transmission system" be construed in accordance with its plain meaning (for the
10 reasons described in § I(A) above, the specification precludes that construction.) In effect, Acacia is
11 simply asking the Court to remove the "means" language from its construction and thereby limit
12 "transmission system" to cover only the particular interconnected components of figures 2a and 2b
13 and not any structural equivalents of those components. The Round 3 defendants obviously have no
14 objection to this.
15

16 **II. THE COURT'S MARKMAN III CONSTRUCTION OF "RECEIVING SYSTEM" IS** 17 **CORRECT**

18 In Markman III, the Court concluded that the patentees intended "receiving system,"
19 like "transmission system," to have a specialized meaning. (Markman III at 10.) Specifically, the
20 Court adopted the following construction:
21

22 an apparatus which directly receives information from the transmission
23 system. The apparatus comprises the following interconnected
24 components: transceiver means, receiver format conversion means,
25 storage means, decompressing means and output data conversion
26 means, as illustrated in Figure 6. The corresponding structure for each
27 means is the structure identified in the specification for performing the
28 recited function. A 'reception system' is the same apparatus as a
'receiving system.' A 'receiving device' is not part of a receiving
system.

(Markman III at 11.)

1 Acacia's criticism of the Court's construction of "receiving system" parallels its
2 criticism of the Court's construction of "transmission system," and is incorrect for all of the same
3 reasons. Nonetheless, Acacia's baseless argument that the patent describes a variety of different
4 receiving systems requires further comment.
5

6 The summary of the invention in columns 2-3 of the specification describes "...
7 receiver format conversion means ... for converting the compressed formatted data blocks into a
8 format suitable for storage and processing resulting in playback in real time; storage means, coupled
9 to the receiver format conversion means, for holding the compressed formatted data; [and]
10 decompressing means, coupled to the receiver format conversion means, for decompressing the
11 compressed formatted information" (col. 3:3-11.) Acacia argues that the receiving system
12 depicted in figure 6 is inconsistent with the system described in the summary of the invention in
13 columns 2-3, because figure 6 shows storage **203** and data formatter **204** in between the receiver
14 format converter **202** and decompressors **205**.
15

16 Contrary to Acacia's argument, there is no inconsistency between the receiving
17 system depicted in figure 6 and its summary in columns 2-3. Decompressor **205** contains separate
18 audio and video decompressors **208** and **209**, respectively (col. 18:27-29; Fig. 6.) The function of
19 data formatter **204** is to prepare the compressed data for decompression by "processes[ing] the
20 compressed formatted data blocks and distinguish[ing] audio information from video information."
21 (col. 18:23-26.) Therefore, just as precompression processing is part of the compression means in
22 the transmission system, pre-decompression processing is part of the decompressing means in the
23 receiving system.
24
25

26 Nor is there any inconsistency due to the presence of storage **203** in figure 6. The
27 explanatory text of the specification explains that storage **203** is employed only in one specific
28

1 situation – when the user wants to play back the requested material at a later time. (col. 18:14-21.)¹⁷
2 In the situation when playback is desired at the time it is requested, there is no need for temporary
3 storage **203** and the data is sent directly for formatting and decompression. (col. 18:22-29.) Thus,
4 the explanatory text makes it clear that there is another line, not shown in figure 6, between receiver
5 format converter **202** and data formatter **204**. The same two paths (storage for delayed playback;
6 decompression for immediate playback) are outlined in columns 2-3: the receiver format conversion
7 means is coupled to a storage means “for holding the compressed formatted data” for playback at a
8 future time, (col. 3:7-9), and is *also* coupled to a decompressing means for immediate playback
9 without intervening storage. Thus, the *same* configuration is described in both figure 6 and its
10 summary in columns 2-3. There is no inconsistency.¹⁸

13 Acacia also relies on originally-filed claims 22 and 23 as support for its contention
14 that the specification discloses different receiving systems. (Acacia Br. at 9-10.) As with
15 “transmission system,” however, not only do these originally filed claims not help Acacia, they
16 actually demonstrate that the Court’s construction of “receiving system” properly captures the
17 broadest scope of “receiving system” that the patentees contemplated, disclosed and considered their
18 invention. Claim 22, the only independent claim which defines what a receiving system is, *contains*
19

21
22 ¹⁷“In the reception system **200** of the present invention, the user may want to play back the
23 requested item from the source material library **111** at a time later than when initially requested. *If*
24 *that is the case*, the compressed formatted data blocks from the receiver format converter **202** are
25 stored in storage **203**. Storage **203** allows for temporary storage of the requested item until playback
is requested.” (col. 18:14-21) (emphasis added).

26 ¹⁸According to Acacia’s reading of the receiving system description at col. 2-3, the storage
27 means is not coupled to the decompressing means at all. Therefore, there would be no way to
28 decompress and output the data stored in the storage means. Once again, Acacia is reading one
description of the only embodiment in a way that would render it inoperable, and is then relying on
that inoperable description as an alternative embodiment.

every single limitation which the Court included in its construction of “receiving system.” Below is a comparison of originally-filed claim 22 and the Court’s construction of “receiving system”:

Originally Filed Claim 22 (Block Decl. Ex. 1 at claim 22)	Court’s Construction Of “Receiving System” (Markman III at 11)
22. A receiving system responsive to a user input identifying a choice of an item stored in a source material library to be played back to the subscriber at a location remote from the source material library, the item containing information to be sent from a transmitter to the receiving system, the receiving system comprising:	A “receiving system” is an “apparatus [which] comprises the following interconnected components:”
transceiver means, for automatically receiving the requested information from the transmitter as compressed formatted data blocks;	“transceiver means,”
receiver format conversion means, coupled to the transceiver means, for converting the compressed formatted data blocks into a format suitable for storage and processing for playback in real time;	“receiver format conversion means,”
storage means, coupled to the receiver format conversion means, for storing the compressed formatted data;	“storage means,”
decompressing means, coupled to the receiver format conversion means, for decompressing the compressed formatted information; and	“decompressing means,”
output data conversion means, coupled to the decompressing means, for playing back the decompressed information in real time at a time specified by the user.	“output data conversion means.”

Originally-filed claim 22 thus demonstrates that the Court’s construction of “receiving system” is not just the broadest conception of a “receiving system” that the applicants disclosed, it is the very “receiving system” which the applicants described as the broadest invention they had. The Court was thus correct in construing the claim term “receiving system” in accordance with this definition. (See *supra* at § I(A)(1).)

1 Acacia asserts that the system of originally-filed claim 23 is “different” from the
2 receiving system described in columns 2-3 because it includes a “user interface means.” This
3 argument leads nowhere. The statement that the one consistently-described receiving system can
4 also have a “user interface means” does not constitute a “different” embodiment - it is an add-on to
5 the same one embodiment. The Court’s construction is consistent with the broadest conception of
6 “receiving system” that the patentees had and disclosed in columns 2-3, in figure 6 and its
7 explanatory text, and in the broadest originally-filed “receiving system” claim. If anything, there is a
8 hint of desperation in Acacia’s attempt to rely on a “user interface means,” for which there is not
9 even any corresponding structure disclosed in the specification, as a reason that the Court should (i)
10 ignore *all* of the components that are consistently described as being part of the receiving system in
11 columns 2-3 and figure 6; and (ii) construe “receiving system” as any device which receives,
12 notwithstanding the fact that the invention itself is a “transmission and receiving system.”¹⁹
13
14
15

16 ¹⁹In footnotes, Acacia takes issue with two other aspects of the Court’s construction of
17 “receiving system.” (Acacia Br. at 13 n.17-18.) First, Acacia disagrees with the Court’s conclusion
18 that the “receiving device” described at col. 18:41 is different from the “receiving system.”
19 (Markman III at 10-11.) But the Court was plainly correct. The specification says that the “receiving
20 device” is a playback device “such as a TV or audio amplifier” (col. 18:36-37); it is not the elaborate
21 “receiving system” of figure 6 which performs such functions as storage, format conversion and
22 decompression.

23 Second, Acacia disagrees with the Court’s conclusion that the receiving system must *directly*
24 receive information from the transmission system. This is simply an attempt by Acacia to vitiate the
25 claim limitations that require the transmission system to send to the receiving system. As explained
26 more fully in the Round 3 Defendants’ 8/11/06 brief at 67, if the transmission system sends the
27 information to some intermediate system, and that system then sends the information to the receiving
28 system, it was not the transmission system which sent the information to the receiving system at all.
That is the reason why the specification uniformly discloses only direct transmission from the
transmission system to the receiving system – no intermediary system is ever described. Even
Acacia admits that the function of the “receiving system” is to receive the transmission from the
“transmission system”: “Although the term ‘receiving system’ is not itself separately defined in the
IEEE Dictionary, as evidenced by the repeated use of that term in the prior art, **the term ‘receiving
system’ would have been understood by persons of ordinary skill in the art as a system that**

(continued...)

1 Those of ordinary skill in the art reading the specification would understand the term
2 “receiving system” to refer to the system depicted in figure 6. As Dr. Walters explains, the term
3 “receiving system” does not have a single plain meaning. Those of ordinary skill in the art would
4 understand that its meaning has to be determined by the context in which it is used. When used in
5 conjunction with plain meaning “transmission system,” however, those of ordinary skill in the art
6 would understand “receiving system” to refer to the specific components which receive the
7 information-bearing signal from the physical medium and undo the processing for transmission
8 performed by the transmission system. In figure 6, then, that would comprise only transceiver 201
9 and “receiver format converter” 202. (Walters Decl. ¶ 29.)
10
11

12 In the specification, however, the term “receiving system” is used to refer to the entire
13 system shown in figure 6. Therefore, since the only contextually appropriate plain meaning for the
14 term “transmission system” is incompatible with the use of “receiving system” in the specification,
15 those of ordinary skill in the art would understand that the patentees gave the term a special meaning,
16 and would read the term “receiving system” as used in the patents as meaning the specific, entire
17 system depicted in figure 6. (Walters Decl. ¶ 30.)
18

19 Finally, Acacia complains about the Court’s use of “means” language in the
20 construction of “receiving system.” For the reasons described above in § I(C) with respect to
21 “transmission system,” the Court’s use of means language was appropriate, and covers the particular
22 interconnected components of figure 6 and their structural equivalents. And, as with “transmission
23 system,” Acacia’s complaint does not support its own construction ,but rather constitutes a request
24 that the Court remove the “means” language from its construction and thereby limit “receiving
25

26
27 ¹⁹(...continued)
28 **receives the transmitted information from the ‘transmission system’”** (Acacia Br. at 13:1-4)
(emphasis added).

1 system” to cover only the particular interconnected components of figure 6 and not any structural
2 equivalents of those components. The Round 3 defendants have no objection to this.

3 **III. THE COURT’S CONSTRUCTION OF “SEQUENCE OF ADDRESSABLE DATA**
4 **BLOCKS,” WHILE CORRECT, SHOULD BE CLARIFIED**

5 Although Acacia submitted extensive briefing on the Court’s construction of
6 “sequence of addressable data blocks,” (Acacia Br. at 13-20), it is apparent that Acacia, the Round 3
7 Defendants and the Court are all in substantial agreement as to what is required before data blocks²⁰
8 become “addressable.” For example, Acacia and the Round 3 Defendants agree that before data
9 blocks can be “addressable,” the starting storage location of the file containing those data blocks
10 must be known. (*Id.* at 14-16.) Both Acacia and the Round 3 Defendants also believe that the
11 Court’s construction recognizes this requirement: “In its construction, the Court states that
12 ‘[a]ddressability does not refer to physical storage locations, but rather to positions relative to the
13 beginning of a file containing information.’ The Court’s construction thus recognizes that
14 ‘addressability’ in this phrase requires that the starting location of where the file will be stored be
15 known.” (*Id.* at 14:11-14.) The Round 3 Defendants believe this requirement should be included
16 expressly in the Court’s construction to avoid jury confusion on this issue.

17
18
19 Although Acacia, the Round 3 Defendants and the Court also all agree that each individual data
20 block is addressable only because its position relative to the starting storage location of the file, the
21 “relative address,” must also be known. (*Id.* at 14-16; Markman III at 27-28.) The only
22 disagreement Acacia has with both the Court and the Round 3 Defendants is that Acacia believes
23 that the relative addresses must be time codes.
24

25
26
27 ²⁰The Round 3 Defendants asked the Court to construe “data block” to mean “a unit of
28 information consisting of identification codes, data and error-checking codes.” (Round 3
Defendants’ 8/11/06 Br. at 43-44.) The Court has not yet construed this term.

1 We will speak first to the area of disagreement relating to “relative addresses,” after
2 which we will propose a clarification to the Court’s construction with respect to the agreed
3 requirement that the starting storage location of the file containing the data blocks be known.
4

5 **A. Relative Addresses Need Not Be Time Codes**

6 Acacia takes issue with the Court’s conclusion that “ordering the . . . signals into a
7 sequence of addressable data blocks” “is a very broad limitation which could include time encoding,
8 as well as other ways of generating addressable data blocks.” (Markman III at 27.) In other words,
9 the relative addresses need not be limited to time codes, but is broad enough to cover any ordering
10 scheme by which the position of data blocks relative to the starting storage location of the file is
11 known. Acacia argues that the relative addresses should be limited to time codes. (Acacia Br. at 16-
12 20.)
13

14 Acacia is wrong. Both the concepts of “addressing” and “relative addressing” are
15 well known,²¹ and neither is limited to use of time codes:
16

17 **address** *As a noun*, the value that represents an individually accessible storage
18 location. In a typical computer, each memory location has a separate address. The
19 addresses for the memory system are numbered 0, 1, 2, and so on, up to the maximum
20 possible number of locations supported . . .

21 *As a verb*, to reference a storage location.

22 (Benyacar 8/11/06 Decl., Docket No. 197, Ex. E (*Computer Dictionary* (2d ed., Microsoft Press
23 1994)) at 12.)

24 **relative address** . . . A location, as in a computer’s memory, that is calculated in
25 terms of its distance (displacement) from a starting point (base address). A relative
26 address is typically computed by adding an offset to the base - in everyday terms, this
27 is similar to creating the address 2001 Main Street, in which the base is the 2000
28 block of Main Street and the offset is 1, which specifies the first house from the
beginning of the block. (Microsoft Dictionary, p. 336.)

21“Addressing” and “relative addressing” had the same meaning in 1991 as they have today.
(Walters Decl. ¶ 39.)

1 (Benyacar 8/11/06 Decl. Ex. E at 336.) Many ways of “addressing” and “relative addressing” other
2 than using time codes are well known. For example, “relative addressing” can be achieved by using
3 simple sequential ordering of data blocks from 1-N in conjunction with the storage location of the
4 start of the file. Those having ordinary skill in the art simply would not understand the concepts of
5 addressing or relative addressing to be limited to the use of time codes.²² (Walters Decl. ¶ 40.)
6

7 Essentially acknowledging this fact, Acacia relies on the same line of cases cited
8 *supra* at § I(A)(1) above and argues that the concept of addressing should be limited to using time
9 codes because only time codes are “disclosed or suggested in the patent specification for achieving
10 addressability.” (Acacia Br. at 16-17.) These cases do not permit the Court to limit “sequence of
11 addressable data blocks” to the use of time codes. While it is true that a patentee cannot claim more
12 broadly than what is disclosed in the specification, it is not true that claim terms can always be
13 construed as limited to what is disclosed in the specification. If there is no basis in the specification
14 for construing a claim term to be coextensive with the scope of the disclosure, then the claim does
15 not satisfy the written description requirement, and cannot be judicially rewritten to save its validity.
16
17 *Liebel-Flarsheim Co. v. Medrad, Inc.*, 358 F.3d 898, 911 (Fed. Cir. 2004).
18

19 There are many reasons why the terms “transmission system” and “receiving system”
20 must be construed in accordance with the scope of their use in the specification. For example, the
21 terms are used in the specification in a manner incompatible with their plain meaning, indicating that
22 the patentees coined new meanings for these terms and precluding adoption of the plain meaning as
23 the construction. In addition, the patentees stated that the system depicted in figures 2a and 2b *is* the
24 transmission system, and that the system depicted in figure 6 *is* the receiving system. The entire
25

26
27 ²²Acacia also relies on a use of time codes unrelated to addressing. (Acacia Br. at 17-18.)
28 This is irrelevant to the issue of whether or not addressing must be limited to the use of time codes.

1 invention is a new transmission system and receiving system. Indeed, all of the intrinsic evidence,
2 including the originally filed claims, teaches that “transmission system” means figure 2 and
3 “receiving system” means figure 6.
4

5 None of these factors exist with respect to “sequence of addressable data blocks.” For
6 example, the plain meaning of “addressable” is consistent with its use in the specification. The
7 patentees never equate addressability with time codes or in any way define, implicitly or explicitly,
8 addressability to require time coding. The Yurt patents are not directed to new ways to address data
9 blocks. The intrinsic evidence simply does not support, much less compel, limiting “sequence of
10 addressable data blocks” to the use of time codes.
11

12 With the claim limitation “sequence of addressable data blocks,” the applicants were
13 attempting to claim more broadly than the use of time codes which, as Acacia says, is the only
14 scheme for addressing which is contemplated and disclosed. Because there is no basis in the
15 specification for limiting addressability to time coding, however, the claims fail to satisfy the written
16 description requirement. *Nazomi Commc’ns, Inc. v. Arm Holdings, PLC*, 403 F.3d 1364, 1368 (Fed.
17 Cir. 2005) (the Court “should not rewrite claims to preserve validity.”).
18

19 **B. The Court Should Clarify its Construction to Explicitly State That “Addressable**
20 **Data Blocks” Means That the Storage Location of the Start of the File**
21 **Containing the Data Blocks Is Known**

22 As discussed above, both Acacia and the Round 3 Defendants agree that the word
23 “addressable” in the phrase “sequence of addressable data blocks” means that the storage location of
24 the start of the file containing the data blocks is known. (Acacia Br. at 14-16.) It further seems to
25 both of us that the Court intended to incorporate this requirement into its construction with the
26 language “[a]ddressability does not refer to physical storage locations, but rather to *positions relative*
27 *to the beginning of a file containing information.*” (Acacia Br. at 14:11-14) (emphasis added).
28

1 However, the Round 3 Defendants respectfully submit that the Court’s construction might be
2 confusing to the jury. For example, although it seems that the language “addressability does not
3 refer to physical storage locations” was intended to convey that the individual storage locations of
4 each of the individual data blocks are not separately assigned, the jury may be confused in attempting
5 to reconcile this language with the fact that there is one physical storage location which must in fact
6 be known - the physical storage location of the beginning of the file containing the data blocks.
7

8 Therefore, the Round 3 Defendants propose that the Court clarify its construction as follows:

9 Addressable does not refer to physical storage locations of each of the
10 individual data blocks, but rather to the single known physical storage
11 location of the start of the file containing the data blocks and positions
12 of each of the data blocks relative to that known starting storage
 location.

13 **IV. THE COURT CORRECTLY ADOPTED ACACIA’S ORIGINAL POSITION THAT**
14 **“STORING” REQUIRES THE AFFIRMATIVE ACT OF “PLACING”**

15 In construing the phrase “storing items having information in a source material
16 library,” the Court observed that “[t]he word ‘storing’ is an active verb with a common meaning.”
17 (Markman III at 30.) The Court held that “words such as ‘placing’ or ‘putting’ are appropriate
18 synonyms for ‘storing’ in the context of Claim 41.” (*Id.*)

19 Although Acacia now challenges the Court’s construction, arguing that “storing”
20 should be construed as a passive step (“retaining”), rather than an active step (“placing”), Acacia
21 knows that this challenge is meritless. For nearly three years, Acacia itself consistently, repeatedly
22 and correctly argued to this Court that “storing” does require “placing.” Its 180° about-face, which
23 comes for the very first time in its reconsideration motion, is as untimely as it is unsupportable.
24
25
26
27
28

1 **A. Throughout this Litigation, Acacia Itself Has Repeatedly and Consistently**
2 **Argued That “Storing” Requires the Active Step of “Placing” Or “Adding”**

3 Acacia conspicuously fails to mention that it is *Acacia* who originally, and
4 continuously thereafter, advocated “placing” as the proper construction of “storing.” In its Claim
5 Construction Brief dated January 8, 2004, Acacia argued that the phrase “storing items having
6 information in a source material library” should be construed as “the act of placing items having
7 information in a source material library for later use” (Benyacar Decl. Ex. F (Acacia 1/8/04 Br.)
8 at 23.) Acacia specifically emphasized that the word “storing” is used in claim 41 “to describe a
9 definite action – the act of ‘storing.’” Acacia repeated the point in its brief in opposition to the
10 Round 1 Defendants’ claim constructions. Relying on the same portion of the specification it now
11 relies on in support of the exact opposite proposition (col. 18:53-55), Acacia reiterated that “storing”
12 in the context of claim 41 means “placing.” After all, Acacia said, “claim 41 of the ’992 is a method
13 claim, and therefore its claim limitations must be acts” (Benyacar Decl. Ex. G (Acacia 1/22/04
14 Br.) at 19-20.)²³ The Court accepted Acacia’s arguments, and construed “storing items having
15 information in a source material library” to mean “adding”²⁴ items having information to a collection
16 of existing materials.” (Markman I at 25:18-19.)
17
18

19 Acacia modified its position somewhat in 2006, although always including the active
20 requirement of “adding” in its proposed constructions. In its opening brief on the terms for which
21
22

23 ²³Acacia thus reaches new heights of disingenuousness when it states that it “is not aware of
24 any statute or Federal Circuit case which has ever set forth the legal requirement that every step in
25 method claim be a ‘manipulative step or act.’” (Acacia Br. at 21.) Acacia itself provided the
26 following string cite in its 1/22/04 Br., (Benyacar Decl. Ex. G at 20 n.8), for this very proposition:
27 “35 U.S.C. § 101 (permitting claims on ‘processes’); Tilghman v. Proctor, 102 U.S. 707, 727 (1880)
28 (‘A process is an act, or a mode of acting’); Cochrane v. Deener, 94 U.S. 780, 788 (1876) (‘A
process is ... an act, or a series of acts’).”

²⁴“Adding” has the same meaning as “placing” in this context.

1 the Round 3 Defendants sought reconsideration, Acacia asked the Court to change its construction of
2 “storing” from “adding” to “adding *and* maintaining”: “[t]he term ‘storing should be construed to
3 mean both ‘adding’ and ‘maintaining’ and therefore the Court construction should be modified to
4 read as follows: ‘adding items having information to a collection of existing materials and
5 maintaining the items having information in the collection.’” (Acacia 7/21/06 Mem., Docket No.
6 184, at 68.)

7
8 Then, after the Round 3 Defendants pointed out that the “storing” limitation lacks
9 written description pursuant to 35 U.S.C. § 112, (Round 3 Defendants’ 8/11/06 Br. at 22-23), Acacia
10 changed its mind again, and in its Reply brief asserted that the “storing” limitation should be
11 construed to mean “adding *or* maintaining.” (Acacia 8/25/06 Mem., Docket No. 208, at 55-57.)
12 Even Acacia’s third proffered construction doesn’t save the claim, however. As the Round 3
13 Defendants explained at the September 7, 2006 Markman hearing, “adding or maintaining” is still
14 broad enough to cover “adding,” meaning the phrase “storing items having information in a source
15 material library” still lacks written description. (9/7/06 Tr. at 123:25-124:13.) This is the motivation
16 for Acacia’s present, fourth proposed construction of “storing.”
17
18

19 Now, *in a reconsideration motion*, Acacia argues for the very first time that “the
20 method does not begin with the placement of any item into the source material library,” but rather
21 “storing” means only “retaining.” (Acacia Br. at 20-24.) It is respectfully submitted that, in light of
22 this history, the Court should not be receptive to Acacia’s new position. *See Liebel-Flarsheim Co. v.*
23 *Medrad, Inc.*, 481 F.3d 1371, 1380 (Fed. Cir. 2007) (applying the motto “beware of what one asks
24 for” to a patentee who successfully pressed for a certain claim construction only to find that the
25 construction invalidated the patent under 35 U.S.C. § 112).
26
27
28

1 **B. In the Context of Claim 41, “Storing” must Be the Active Step of “Placing”**

2 Acacia’s new argument that “storing” does not involve any active “placing” or
3 “adding” is not only inconsistent with its earlier stance, but it is also inconsistent with the language
4 of claim 41. Claim 41 claims a method “comprising . . . steps, *performed* by a transmission system.”
5 (emphasis added). The term “performed” describes action, not passivity.²⁵ Indeed, all of the other
6 steps of claim 41 are active steps – retrieving, assigning, placing, compressing, sending. In context,
7 it is clear that the “storing” step is an active step as well.
8

9 Additionally, “[a] claim construction that gives meaning to all the terms of the claim
10 is preferred over one that does not do so.” *Merck & Co., Inc. v. Teva Pharms. USA, Inc.*, 395 F.3d
11 1364, 1372 (Fed. Cir. 2005). Acacia’s construction of “storing” to mean “retaining” would vitiate
12 the first step of claim 41, because the second step of the claimed method, “retrieving the information
13 in the items from the source material library,” necessarily implies that the items are already present
14 in the source material library – *i.e.*, that they are “retained” there. Thus, under Acacia’s construction,
15 the first step, “storing,” would be entirely superfluous.
16

17 Moreover, Acacia’s proposed definition of “storing” as a passive “retaining” step is at
18 odds with the sequential nature of claim 41. As the Court has stated, and as Acacia has admitted,²⁶
19 “[t]he language of Claim 41 makes each step antecedent to each succeeding step. . . . [A] step, which
20 is antecedent to a succeeding step, must commence before the succeeding step commences, *and the*
21 *antecedent step must finish before the succeeding step can finish.*” (Markman III at 29) (emphasis
22
23

24 _____
25 ²⁵See *Webster’s Collegiate Dictionary* 860 (10th ed. 2001) (“PERFORM implies action that
26 follows established patterns or procedures or fulfills agreed upon requirements . . .”).

27 ²⁶See Acacia’s 4/17/06 Brief, Docket No. 145-2, at 56-57: “The steps of claim 41 of the ’992
28 patent must be performed in the following order: . . .”, and thereafter reciting all of the steps of
claim 41 in the order they appear in the claim.

1 added). But under Acacia’s proposed construction, the first step – “storing items . . . in a source
2 material library” – is *never* finished, because items remain (that is, they are “retained”) in the source
3 material library indefinitely. And given the Court’s ruling regarding the order of claim 41’s steps,
4 that would mean that the remaining steps of the claim are never finished either – thus destroying the
5 sequential nature of the claim and leading to the ridiculous result that the claimed method could
6 never be completed. It goes without saying that such a construction cannot be proper.

8 Thus, to preserve both the sequential nature of claim 41 and any rational meaning of
9 the claim pursuant to which the practice of it can be successfully completed, each step must be
10 discrete in time – it must have a beginning and an end. An active step (“placing”) satisfies that
11 requirement, while a passive step (“retaining”) does not.²⁷

13 Even Acacia seems to agree. In response to the Court’s request for additional briefing
14 on when the “generating” step of claim 46 takes place, Acacia answered that the step takes place
15 “after either the items . . . are stored in the source material library or after the files having the
16 compressed, formatted, sequenced data blocks are stored.” (Acacia 5/23/07 Claim 45-46 Br., Docket
17 No. 241, at 3.) By saying that the “generating” step takes place “after” the items are stored, Acacia
18 necessarily acknowledged that the “storing” step is the temporally discrete, active step of placing the
19 items in the source material library (otherwise, the generating step would be concurrent with the
20 storing, and could not occur “after” the items are stored). As Acacia recognized, one simply cannot
21 order the steps unless “storing” is interpreted as the discrete, active step of “placing.”
22
23
24

25 ²⁷The example provided by Acacia of leaving a pan in an oven for 45 minutes before
26 removing it from the oven, (Acacia Br. at 22), is not analogous for at least two reasons: (i) the step of
27 leaving the pan in the oven gets completed, meaning the claimed method can be completed; and (ii)
28 the pan is being heated when it is in the oven, which is an active step - simply “retaining” for an
indefinite period is not active.

1 Thus, the language and structure of claim 41 confirm the Court’s construction of
2 “storing” as an active verb, synonymous with “placing” or “putting.”

3
4 **C. The Patentees’ Use of the Word “Inputting” in Claim 14 of the ’863 Patent
Supports the Court’s Construction of “Storing”**

5 Acacia argues that because claim 14 of the ’863 patent uses the word “inputting” –
6 which everyone agrees means “putting in” – the term “storing” in claim 41 of the ’992 patent cannot
7 have the same meaning. Quite the contrary. The patentees used the words “inputting” and “storing”
8 interchangeably; in the context of claim 41, they mean the same thing.
9

10 Acacia misstates and oversimplifies the law when it asserts that there is a presumption
11 that different claim terms have different meanings. “[W]here neither the plain meaning nor the
12 patent itself commands a difference in scope between two terms, they may be construed identically.”
13 *Power Mosfet Techs., LLC v. Siemens AG*, 378 F.3d 1396, 1410 (Fed. Cir. 2004). As the Federal
14 Circuit explained in *Curtiss-Wright Flow Control Corp. v. Velan, Inc.*, 438 F.3d 1374, 1380 (Fed.
15 Cir. 2006) (emphasis added):
16

17 Different claims with different words can, of course, define different
18 subject matter within the ambit of the invention. On the other hand,
19 *claim drafters can also use different terms to define the exact same*
20 *subject matter*. Indeed, this court has acknowledged that two claims
with different terminology can define the exact same subject matter.

21 Here, it is clear that the same step – “the exact same subject matter” – was described by the patentees
22 in two different ways: “storing items having information in a source material library,” (’992 Patent,
23 claim 41), and “inputting an item having information into the transmission system,” (’863 patent,
24 claim 14.) The two phrases are worded differently, but describe the same step.

25 Acacia argues that the specification does not describe placing items in the source
26 material library. While true, this argument does not advance Acacia’s claim construction. The lack
27 of a written description in the specification did not prevent the patentees from including an
28

1 “inputting” step in claim 14 of the ’863 patent. By the same token, it did not prevent the patentees
2 from including the same substantive step in claim 41 of the ’992 patent.

3 **V. THE COURT CORRECTLY CONCLUDED THAT CLAIM 45 OF THE ’992**
4 **PATENT IS ARGUABLY INDEFINITE**

5 The Court recognized that dependent claim 45 of the ’992 patent cannot be reconciled
6 with claim 41 from which it depends, and that the specification does not help to resolve claim 45's
7 ambiguity because the claim is directed to a method which is not even described in the specification.
8 Therefore, the Court correctly held that claim 45 is “arguably indefinite” without the need for,
9 without requesting and without authorizing any further briefing on the subject.²⁸

11 Claim 45 recites:

12 45. A transmission method as recited in claim 41, wherein the storing
13 step further comprises the step of:
14 separately **storing a plurality of files**, each including
compressed, sequenced data blocks.

15 The referenced “storing step” of claim 41 is “storing, **as a file**, the compressed, formatted, and
16 sequenced data blocks with the assigned unique identification code.” The subsequent step of claim
17 41 is “sending at least a portion of **the file** to one of the remote locations.” As the Court pointed out,
18 the specification does not describe storage in multiple files as a step of any disclosed method, and
19

20
21 ²⁸Acacia states that the “Court sought additional information [with respect to] whether claim
22 45 of the ’992 is indefinite,” and that its arguments with respect to claim 45 are therefore “not
23 reconsideration issues.” (Acacia 5/23/07 Br. at 1:2-5.) This is simply untrue. The Court addressed
24 claim 45 in Markman III at 32:24-33:12, and did not seek or permit any additional briefing therein
25 with respect to claim 45 or the Court’s conclusion that the claim is arguably indefinite. If Acacia
desired reconsideration of the Court’s ruling with respect to claim 45, it should have complied with
the Court’s April 26, 2007 Order and submitted a timely brief.

26 In all events, because Acacia did not comply with the Court’s April 26, 2007 Order with
27 respect to any of the arguments made in its 5/23/07 brief on the grounds that those arguments “are
28 not reconsideration issues,” Acacia is not entitled to a Reply brief with respect to any of those
arguments.

1 there is therefore no intrinsic evidence to help resolve the insoluble facial ambiguity of claim 45 with
2 respect to how “multiple files” are used in the method of claim 41. The Court therefore concluded
3 that the phrase “separately storing a plurality of files” is arguably indefinite. (Markman III at 33.)
4

5 **A. Acacia Mischaracterizes the Court’s Opinion**

6 The gist of Acacia’s argument is that the specification discloses storage devices, such
7 as the compressed data library **118**, which hold more than one file. But as set forth below, the Court
8 specifically took note of that fact – and found it irrelevant. Specifically, the Court observed that
9 “‘separately storing a plurality of files’ is an attribute of the compressed data storing means **118**,” but
10 “[t]he attribute of being capable of storing a plurality of files does not lend itself to conversion to a
11 manipulative step.” (Markman III at 33 n.12.) In other words, there is no disclosure of a method
12 which processes related data, assigns that data a single unique identification code, and later stores
13 related data in separate files.
14

15 Acacia ignores the fact, recognized by the Court, that the claim 45 step – “separately
16 storing a plurality of files” – must relate to the “method of transmitting information to remote
17 locations” that is set forth in claim 41, from which claim 45 depends. The question then arises: how
18 does “separately storing a plurality of files” fit into the method of storing items in a source material
19 library; retrieving information from those items; assigning a unique identification code; formatting,
20 sequencing and compressing the data; “storing, *as a file*, the compressed, formatted and sequenced
21 data blocks”; and “sending at least a portion *of the file* to one of the remote locations”? The
22 specification does not say.
23
24

25 In sum, the specification does not describe using multiple files *in the claimed method*.
26 To the contrary, the data that is transmitted to the remote location is taken from “a file” (singular).
27 Thus, the Court was quite right to conclude that the patent does not describe any method of
28

1 transmitting information in which the information subject to the method is stored in a plurality of
2 files. Thus, claim 45 not only lacks written description, there is no disclosure to rely on to resolve
3 the facial ambiguity of claim 45.

4
5 **B. Claim 45 is indefinite**

6 Claim 45 is indefinite because it is insolubly ambiguous.

7 First, it is unclear how “separately storing a plurality of files, each including
8 compressed, sequenced data blocks” is used in the method of transmitting information to remote
9 locations. As set forth above, the specification does not describe using a plurality of files in such a
10 method.

11
12 Second, claim 41 requires that the compressed, formatted, and sequenced data blocks
13 be stored in a *single* file, while claim 45, which depends from claim 41, requires that the
14 compressed, sequenced data blocks be stored in a *plurality* of files. Thus, claim 45 alters the single-
15 file limitation of claim 41, in violation of 35 U.S.C. § 112 ¶ 4, which requires a dependent claim to
16 “incorporate by reference all of the limitations of the claim to which it refers.” A claim which alters
17 an independent claim instead of limiting it is invalid. *Pfizer Inc. v. Ranbaxy Labs. Ltd.*, 457 F.3d
18 1284, 1291-92 (Fed. Cir. 2006).

19
20 Third, claim 45 incorporates by reference the limitation of claim 41 of “sending at
21 least a portion of *the file* [singular] to one of the remote locations.” The claim is indefinite because it
22 is impossible to know *which one* of the “plurality of files” is to be sent.

23
24 **VI. THERE IS NO WAY TO TELL WHEN THE STEP “GENERATING A LISTING OF
AVAILABLE ITEMS” IN CLAIM 46 TAKES PLACE**

25 The Court asked for further briefing on when the element of claim 46, “generating a
26 listing of available items,” takes place. (Markman III at 33.) Acacia states that this step occurs after
27 items are “available,” and before the next step of claim 46 (“receiving transmission requests”) takes
28

1 place. (Acacia 5/23/07 Br. at 2-3.) The fact is, however, that there is no way to tell when the
2 “generating” step occurs, because the specification does not describe “generating a listing of
3 available items” at all, much less the performance of such a step in a method of transmitting
4 information.
5

6 Acacia cites two passages of the specification (col. 13:29-47, 18:53-19:10) for the
7 proposition that the step of “generating a listing of available items” occurs *either* after the items
8 having information are stored in the source material library, or after the files having the compressed,
9 formatted, and sequenced data blocks are stored. (*Id.* at 3.) However, neither of these passages say
10 anything about generating a list of available items. In fact, although various portions of the
11 specification mention the existence of a listing of available items or titles,²⁹ the specification does not
12 describe (i) the generation of such a list; (ii) when such a listing is generated; or (iii) the step of
13 generating as part of a method for transmitting information. Accordingly, the “generating” step of
14 claim 46 is not only indefinite, it also lacks written description.³⁰
15
16
17
18
19

20 ²⁹(*See* col. 3:58-59) (the user “chooses audio and/or video material from a list of available
21 items”); (col. 11:34-35) (“a catalog listing some or all available titles may also preferably be
22 published”); (col. 17:44-46) (“[t]he library access interface **121** in the reception system **200**
preferably includes a title window where a list of available titles are alphabetically listed.”).

23 ³⁰To the extent the language of the claims provide any suggestion as to when the “generating”
24 step occurs, one would deduce that this step, like all of the steps of claim 46, have to be performed
25 after the claim 41 step of “placing the retrieved information into a predetermined format as formatted
26 data,” but before the claim 41 steps of “placing the formatted data into a sequence of addressable
27 data blocks” and “compressing the formatted and sequenced data blocks.” The reason for this is that
28 the last step of claim 46 refers to retrieving “formatted data blocks,” whereas in claim 41, after the
sequencing and compressing steps, the claim requires storing “compressed, formatted *and* sequenced
data blocks.” Therefore, claim 46 would suggest that its steps take place after formatting, but before
sequencing and compression.

1 **VII. ACACIA’S ATTEMPT TO REWRITE THE SPECIFICATION AT COL. 17:44-53**
2 **SHOULD BE REJECTED**

3 In conjunction with its discussion of claim 46, the Court questioned whether the
4 specification at col. 17:44-53 is in error and should read “in transmission system as shown in figure
5 **2b**” instead of “in the reception system **200**.” (Markman III at 33-34.) There is no reason to believe
6 that this passage from the specification is a mistake. The purpose of a “title window where a list of
7 available titles are alphabetically listed,” which the specification clearly says is part of the library
8 access interface 121, is obviously to display to the *user* a list of choices, so that the *user* can select
9 what he wishes to receive. Perforce, this title window, and the library access interface it is a part of,
10 must be located at the reception system where a user is located – not at the transmission system.
11

12 To be sure, the specification of the Yurt patents is not a model of clarity. But it was
13 the statutory duty of the patentees to include a written description in “full, clear, concise and exact
14 terms”. 35 U.S.C. § 112 ¶ 1. When a patentee fails to meet that standard, the proper course is not to
15 judicially rewrite the patent, but to invalidate it.

27
28

1 **CONCLUSION**

2 For the foregoing reasons, the Court should clarify its construction of “sequence of
3 addressable data blocks,” and should otherwise adhere to its Markman rulings. Further proceedings
4 in the case should be based on the claim constructions contained in those rulings.
5
